

Flow Divider Valve - 20,000 PSI

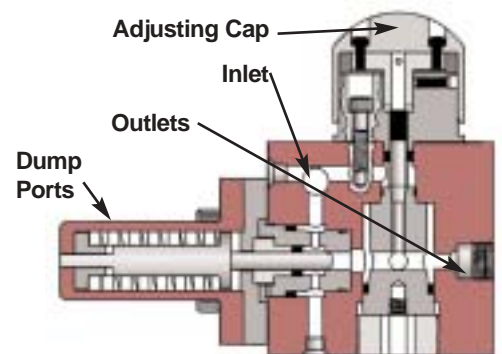

Application/Features:

The FDV-20K (20K Flow Dividing Valve) allows two dump-style control guns to be operated independently from a single pump source without effecting the pressure of the other gun. Additional guns may be run from the same pump by combining several FDVs together using "T" or "Y" connectors. The total pump flow is divided between the control guns and system pressure will be maintained when either gun or both guns are dumping.

Simple to set up. As easy as: **(1) set pressure, (2) lock it in, (3) ready to use.**

Pressure is set by adjusting the two self-locking knobs on top of the unit.

- Adjustment is made by hand (no special tools required).
- The FDV-20K is easily modified to suit various pressures.
- Low pressure drop even with high-flow operations.
- Minimizes pressure surges to operators.
- Highly versatile - run more guns safely by adding more FDVs.
- Constructed of long-life stainless steel components.
- Dimensions: 60 Lbs., 10 1/2" long by 10" wide by 7 1/2" high.

Multi Dump Gun Control System
Pressures to 20,000 PSI
